

Hire Me AI — Full Setup Guide

Make your own version of Hire Me AI: a website where recruiters ask questions and an AI answers from **your** resume. At the end you get your own link to share.

Follow the parts in order. Do not skip steps.

Before you start — what you need

1. A laptop (Windows, Mac, anything).
 2. Two PDF files ready on your computer:
 3. `my_resume.pdf` — your resume (projects, skills, experience).
 4. `more_about_me.pdf` — extra stuff: school, age, hobbies.
 5. The names must match **exactly**, including capital letters.
 6. Free accounts on 4 websites (you will make them as you go):
 7. github.com — stores the code
 8. console.groq.com — the AI brain (free)
 9. render.com — runs the backend for free
 10. lovable.dev — makes the website page
 11. Around 45–60 minutes.
-

Part 1 — Your GitHub repo (the code + your PDFs)

1. Go to **github.com** and sign in (or click **Sign up** and make an account first).
2. Open the original project: **<https://github.com/siddharthjonior7-ux/hire-me-ai>**
3. Click the green **Code** button → **Download ZIP**.
4. Unzip the downloaded file on your computer. You now have a folder with all the code.
5. Go back to GitHub. Click the **+** in the top-right corner → **New repository**.
6. Repository name: `hire-me-ai`. Choose **Public**. Click **Create repository**.
7. On the new empty repo page, click the link "**uploading an existing file**".
8. Drag in **all the files from the unzipped folder** (all code files, `requirements.txt`, etc.). Click **Commit changes**.
9. Now add your two PDFs: click **Add file** → **Upload files**, drag in `my_resume.pdf` and `more_about_me.pdf`, click **Commit changes**.
10. Check the file list at the top of your repo. Look for a file called `.gitignore` (starts with a dot).
 - If you see `gitignore` **without** the dot instead: click it, click the  **pencil icon**, change the file name to `.gitignore`, click **Commit changes**.
 - This file stops your secret key from ever being uploaded to GitHub.

Your repo now has: the code + your two PDFs. This is what the AI reads to answer questions.

Part 2 — Your Groq key (the AI brain)

1. Go to **console.groq.com** and sign up / sign in.
 2. In the left menu, click **API Keys**.
 3. Click **Create API Key**. Give it any name, like `hire-me`.
 4. **Copy the key immediately and paste it somewhere safe** (like Notepad). It is shown only once.
 5. ⚠ **Never put this key on GitHub**. It only goes into Render in Part 3, step 9.
-

Part 3 — Render (the always-on computer)

This runs your backend so it answers questions 24/7. Free plan.

1. Go to **render.com** → click **Get Started** → **Sign up with GitHub** → authorize it.
 2. On the dashboard, click **New +** → **Web Service**.
 3. Find your `hire-me-ai` repo in the list → click **Connect**.
 4. Fill in the settings:
 5. **Name:** `hire-me-ai` (your link will be based on this name; Render may add a few random letters — that's fine)
 6. **Runtime:** `Python 3`
 7. **Build Command:** `pip install -r requirements.txt`
 8. **Start Command:** `uvicorn main:app --host 0.0.0.0 --port $PORT`
 9. **Instance Type:** `Free`
 10. Click **Create Web Service**. Watch the logs — wait until the status says **Live** (takes a few minutes).
 11. Click **Environment** in the left menu → **Add Environment Variable**:
 12. Key: `GROQ_API_KEY`
 13. Value: paste your Groq key from Part 2
 14. Click **Save**.
 15. Click **Manual Deploy** → **Deploy latest commit**. Wait until it says **Live** again.
 16. **Copy your backend URL** from the top of the Render page. It looks like: `https://hire-me-ai-xxxx.onrender.com` Keep it — you need it in Part 4.
-

Part 4 — Lovable (the pretty page)

1. Go to **lovable.dev** and sign in.
2. Click **Create project / Start a project**.
3. Paste this exact message into the chat and press Enter:

Build a one-page site called "Hire Me AI" where recruiters type a question and get a streaming answer from a resume. Editorial resume style: serif display headings, clean sans-serif body, cream/paper background. It must:

- POST to `{API_URL}/chat` with JSON `{"question": "..."}`
- Read the answer as a plain-text stream with a `ReadableStream` reader (NOT `EventSource`), showing words appear live as they arrive
- Show 4 suggested starter questions the visitor can click

- Have a "Download resume (PDF)" button
I will give you my backend URL next.

1. After it builds, send another chat message with **your** backend URL from Part 3, step 8: Use this backend URL: `https://hire-me-ai-xxxx.onrender.com`
2. In the same project's chat, attach **your** `my_resume.pdf` and say: Use this PDF for the resume download button
3. Test it: in the preview, click one of the suggested questions.
4. ⚠ The **first** answer can take ~30 seconds — the free Render server wakes up from sleep. Every answer after that is fast.

Part 5 — Publish and share

1. When you're happy with the page, click **Publish** (top right in Lovable).
2. You get a permanent link like `your-site.lovable.app`.
3. Send that link to anyone. Done! ☐

Common problems and fixes

Problem	Fix
Answer says Internal Server Error	Check step 9 of Part 3 (Groq key added in Render Environment , not GitHub) and that both PDFs are in your GitHub repo. Then Manual Deploy → Deploy latest commit .
Answer says I don't have enough information about school/hobbies	<code>more_about_me.pdf</code> is missing from GitHub, or was uploaded with a different name.
First question after a break is slow (~30s)	Normal. Render's free plan sleeps after 15 quiet minutes. It wakes up on its own.
Nothing shows up at all in the browser	The backend's <code>main.py</code> needs the CORS lines (allowing other sites to read its answers). Make sure you copied the latest code from the original repo.
Wrong answers / talks about someone else's projects	The PDFs in your repo are not yours, or the name doesn't match exactly.

Quick checklist

- [] Code uploaded to my own GitHub repo
- [] `my_resume.pdf` and `more_about_me.pdf` in the repo (exact names)
- [] `.gitignore` has the dot at the start
- [] Groq key created and saved somewhere safe
- [] Render service says **Live**
- [] `GROQ_API_KEY` added in Render Environment

- ☐ Frontend built in Lovable with my backend URL
- ☐ My resume PDF attached for the download button
- ☐ Tested with a question
- ☐ Published and link shared
